

FOR IMMEDIATE RELEASE**CATASTAK™ SCR SYSTEM'S SOURCE TEST REPORTS NOX
EMISSIONS LESS THAN 0.5 PPM**

Fremont, California, February 20, 2009.....Nationwide Boiler Inc. announced final emissions source test results for a CataStak™ Selective Catalytic Reduction (SCR) system installation for a California manufacturer based in the Central Valley. A 700 hp (29.3 MMBtu/hr) natural-gas fired Cleaver-Brooks firetube boiler, equipped with a low NOx burner (with flue gas recirculation) was retrofitted by Nationwide Boiler with a CataStak SCR system, guaranteed to operate at less than 5 parts-per-million (ppm). The unit exceeded Nationwide Boiler's initial guarantee and was recently certified to operate with less than 0.5 ppm NOx, less than the minimum reportable detection limit of the testing method used. Average CO emissions were reported at 13.3 ppm and average ammonia slip was reported at only 0.3 ppm, operating between a stack temperature range of 330 – 366° F (low to high fire).

Nationwide Boiler's CataStak SCR system is a post-combustion control technology, proven to effectively reduce NOx levels to less than 5 ppm. NOx, also known as nitrogen oxides, is a precursor to the formation of ground-level ozone and fine particle pollution. The reduction of emissions of NOx is a crucial component of the Environmental Protection Agency's (EPA) strategy for cleaner air, as well as local state air quality districts.

Nationwide Boiler Incorporated, founded in 1967, provides industrial rental boilers and specializes in low emissions and high efficiency equipment including the CataStak SCR
